AIM:

       To build a dashboard or a frontend display system that will be useful for mcq patterns for students and tells the number of correct answers , wrong answers, number of question attended, not attended and the total marks of the user. In this I have used xampp for storing the database and used php to frame the frontend development.

The Online Quiz Site In PHP is a simple project for taking and giving the MCQs. The project contains an admin side and the user side. The admin can view and manage the users, their rankings, and manage the quiz questions. The purpose of taking the online exam/test is to help the students to practice and learn more about the topic. Also, this online method needs less manpower to execute the examination.

The users are the students who want to take part in this online test site. A user has to login to enter the quiz competition. If he/she has not registered, they can register first and then login. This project is a very simple project that makes a convenient way for any organization to check the performance of the students and rank them according to their doings.

Follow the following steps after starting with apache spark in xampp server:

> ➢ Extract file.
> ➢ Copy the main project folder
> ➢ Paste in xampp/htdocs/
> ➢ Open a browser and go to URL http://localhost/phpmyadmin/
> ➢ Then, click on the databases tab.
> ➢ Create a database naming "quiz" and then click on the import tab
> ➢ Click on browse file and select "quiz.sql" file which is inside the "A-Online-Quiz-Site" folder
> ➢ Click on go.
> ➢ Open a browser and go to URL "http://localhost/ A-Online-Quiz-Site /"
